Human Brain Vascular Pericytes (HBVP) provided by Innoprot are isolated by ScienCell Research Laboratories from human brain tissue. HBVP are cryopreserved at secondary culture after purification and delivered frozen. HBVP are guaranteed to further expand for 15 population doublings in the condition provided by ScienCell Research Laboratories.

Pericytes are contractile smooth muscle-like cells that cover the albuminal surface of microvessels. They are most abundant on venules and are common on capillaries. Three major functional roles have been ascribed to pericytes associated with central nervous system microvascular contractility, regulation of endothelial cell activity, and macrophage activity. There is also evidence that pericytes are involved in the transport across the blood-brain barrier and the regulation of vascular permeability. An important role for pericytes in pathology has been indicated in hypertension, diabetic retinopathy, Alzheimer’s disease, multiple sclerosis and central nervous system tumor formation.

**Recommended Medium**
- Pericyte Medium
  (Reference: P60121)

**Product Characterization**
Immunofluorescent method
- α-smooth muscle actin
The cells test negative for HIV-1, HBV, HCV, mycoplasma, bacteria, yeast and fungi

**Product Use**
THESE PRODUCTS ARE FOR RESEARCH USE ONLY. Not approved for human or veterinary use, for application to humans or animals, or for use in vitro diagnostic or clinical procedures.
**IMPORTANT:** Cryopreserved cells are very delicate. Thaw the vial in a 37 ºC waterbath and return them to culture as quickly as possible with minimal handling!

**Set up culture after receiving the order:**

1. Prepare a poly-L-lysine coated flask (2 μg/cm², T-75 flask is recommended). Add 10 ml of sterile water to a T-75 flask and then add 15 μl of poly-L-lysine stock solution (10 mg/ml). Leave the flask in incubator overnight (minimum one hour at 37ºC incubator).

2. Prepare complete medium: decontaminate the external surfaces of medium and medium supplements with 70% ethanol and transfer them to sterile field. Aseptically open each supplement tube and add them to the basal medium with a pipette. Rinse each tube with medium to recover the entire volume.

3. Rinse the poly-L-lysine coated flask with sterile water twice and add 20 ml of complete medium to the flask. Leave the flask in the hood and go to thaw the cells.

4. Place the vial in a 37ºC waterbath, hold and rotate the vial gently until the contents are completely thawed. Remove the vial from the waterbath immediately, wipe it dry, rinse the vial with 70% ethanol and transfer it to a sterile field. Remove the cap, being careful not to touch the interior threads with fingers. Using a 1 ml eppendorf pipette gently resuspend the contents of the vial.

5. Dispense the contents of the vial into the equilibrated, poly-L-lysine coated culture vessels. A seeding density of 5,000 cells/cm² is recommended. Note: Dilution and centrifugation of cells after thawing are not recommended since these actions are more harmful to the cells than the effect of DMSO residue in the culture. It is also important that pericytes are plated in poly-L-lysine coated culture vessels that promote cell attachment.

6. Replace the cap or cover of flask, and gently rock the vessel to distribute the cells evenly. Loosen cap if necessary to permit gas exchange.

7. Return the culture vessels to the incubator.

8. For best result, do not disturb the culture for at least 16 hours after the culture has been initiated. Change the growth medium the next day to remove the residual DMSO and unattached cells, then every other day thereafter. A healthy culture will display normal smooth muscle cell morphology, nongranular cytoplasm, and the cell number will be double after two to three days in culture.
**Maintenance of Culture:**

1. Change the medium to fresh supplemented medium the next morning after establishing a culture from cryopreserved cells. For subsequent subcultures, change medium 48 hours after establishing the subculture.

2. Change the medium every other day thereafter, until the culture is approximately 50% confluent.

3. Once the culture reaches 50% confluence, change medium every day until the culture is approximately 80% confluent.

4. Harvest and transfer released cells into a 50 ml centrifuge tube. Rinse the flask with another 10 ml of growth medium to collect the residue cells. Examine the flask under microscope to make sure the harvesting is successful by looking at the number of cells left behind. There should be less than 5%.

5. Centrifuge the harvested cell suspension at 1000 rpm for 5 min and resuspend cells in growth medium.

6. Count cells and plate them in a new, poly-L-lysine coated flask with cell density as recommended.

7. Subculture the cells when they are over 90% confluent.

8. Prepare poly-L-lysine coated cell culture flasks (2 μg/cm²).

9. Warm medium, trypsin/EDTA solution, trypsin neutralization solution, and DPBS to room temperature. We do not recommend warming the reagents and medium at 37°C waterbath prior to use.

10. Rinse the cells with DPBS.

11. Incubate cells with 10 ml of trypsin/EDTA solution (in the case of T-75 flask) until 80% of cells are rounded up (monitored with microscope). Add 10 ml of trypsin neutralization solution to the digestion immediately and gently rock the culture vessel.

12. Centrifuge the harvested cell suspension at 1000 rpm for 5 min and resuspend cells in growth medium.

13. Count cells and plate them in a new, poly-L-lysine coated flask with cell density as recommended.

**Caution:** Handling human derived products is potentially hazardous. Although each cell strain tested negative for HIV, HBV and HCV DNA, diagnostic tests are not necessarily 100% accurate, therefore, proper precautions must be taken to avoid inadvertent exposure. Always wear gloves and safety glasses when working these materials. Never mouth pipette. We recommend following the universal procedures for handling products of human origin as the minimum precaution against contamination [1].
